Enzyme

**Happiness Begins with
Good Health**

ENZYMES - Enzymes are protein molecules in cells which work as biological catalysts. Enzymes speed up chemical reactions in the body, but do not get used up in the process, therefore can be used over and over again. They are vital for life and serve a wide range of important functions in the body, such as aiding in digestion and metabolism.

SPECIALITY CHEMICALS

**"Keep It Healthy
With Bioven Ingredients"**

AMINO ACIDS- An amino acid is an organic compound characterized by having a carboxyl group, amino group, and side chain attached to a central carbon atom. Amino acids, often referred to as the building blocks of proteins, are compounds that play many critical roles in your body.

PROTEINS-Proteins are large biomolecules, or macromolecules, consisting of one or more long chains of amino acid residues. Proteins are required for the structure, function, and regulation of the body's cells, tissues, and organs.
